

Introduction

This document describes how to mount a lens tube on an IDS camera. It covers the following lens tubes:

- CK.0010.1.12100.00 lens tube 51 mm, Ø 41 mm
- CK.0010.1.12000.00 lens tube 64 mm, Ø 41 mm
- CK.0010.1.12200.00 lens tube 77 mm, Ø 41 mm

IDS Imaging Development Systems GmbH assume no liability for defects if the lens tube was improperly mounted or dismounted by the customer or a third party.

Prerequisites

Before mounting the tube, store the camera, lens, and lens tube in a cool, dry place for a while. This will prevent condensation on the inside of the lens tube after mounting.

Mounting the lens tube

Note on the tube thread and the camera thread

Check the thread in the tube and the thread at the front part of the camera for damage before mounting. Use only undamaged parts. A damaged thread leads to leakage of the camera.

Note on the O-ring seal at the tube thread

Check the O-ring seal for damage before mounting a protective lens tube. If you will be using the camera without a lens tube for a prolonged time, remove the O-ring seal and store it away from light, as UV light and ozone can cause the O-ring seal to become porous.

NOTICE! If you need to grease the O-ring seal, use only a thin lubricant film of silicone grease.

Proceed as follows

1. Mount your lens.
2. Mount the lens tube on the camera. The lens tube is tight if it is screwed flush on the camera front.

**Note on IP 65/67**

The GigE uEye FA/RE PoE housing version is IP 65/67 compliant. The following requirements must be met for conformance to the IP 65/67 standards:

- A lens tube must be connected.
- Cables must be attached to both connectors during operation. See also the technical manual of the camera.

NOTICE! The camera has not been approved for underwater use.

Dismounting the lens tube

When dismounting the lens tube, make sure that no dust or water can get in the camera housing. Proceed as follows:

1. Dismount the lens tube.
2. Dismount your lens.
